With 12,500 members from nearly 90 countries, INFORMS is the largest international association of operations research (O.R.) and analytics professionals and students. INFORMS provides unique networking and learning opportunities for individual professionals, and organizations of all types and sizes, to better understand and use O.R. and analytics tools and methods to transform strategic visions and achieve better outcomes. For more information on INFORMS, its publications, membership, or meetings visit <http://www.informs.org>

NOTES ABOUT AUTHORS

Adi Ben-Israel ("A Decomposition Method for Interval Linear Programming") is a Professor of Engineering Sciences and of Industrial Engineering and Management Sciences at Northwestern University in Evanston, Illinois. Technion—Israel Institute of Technology awarded him the B.Sc. in mechanical engineering in 1955 and the M.Sc. in operations research and statistics in 1959; Northwestern University awarded him the Ph.D. in engineering sciences in 1962. For two years he was a Senior Lecturer of mathematics at Technion. The author has published about 50 articles in *Mathematics*, *Mathematical Programming*, *Operations Research*, and *Statistics and Engineering*. The author's present research is in theory and applications of linear inequalities, mathematical programming, and matrix theory and application. The author is a member of the American Mathematical Society, the Mathematical Association of America, the Society for Industrial and Applied Mathematics, and the Israel Mathematical Union.

Eric V. Denardo ("On Linear Programming in a Markov Decision Problem") is an Associate Professor in the Department of Administrative Sciences at Yale University. He received a B.S. from Princeton University in 1958 and a Ph.D. from Northwestern University in 1965. He was employed by Western Electric Engineering Research Center and The Rand Corporation. His primary research interest is in dynamic programming, with a lesser interest in air transportation, especially airport design.

F. J. Gould ("A Class of Inside-Out Algorithms for General Programs") is an Associate Professor in the Department of Statistics and the Graduate School of Business at the University of North Carolina in Chapel Hill. He received the B.S. in biochemistry from the University of Chicago; the M.S. in mathematics from Illinois Institute of Technology; and the Ph.D. in operations research from the University of Chicago. Dr. Gould held the post of Assistant Professor at the University of Chicago and has been a consultant to the Academy for Interscience Methodology, Teknekron, and the Military Airlift Command. In addition to several papers on nonlinear programming scheduled to appear, he has written "A Lagrangian Application to Production Models" (with Gary D. Eppen), which appeared in *Operations Research*, July-August 1968; "Extensions of the Planning Horizon Theorem in the Dynamic Economic Lot Size Model," (with Gary D. Eppen and B. P. Pashigian), which appeared in *Management Science*, January, 1969. The author has done research in nonlinear programming and produc-

tion theory, and is now doing research in constraint qualifications and Lagrange regularity, nonlinear duality, and computational aspects of nonlinear programming codes. He is a member of TIMS, ORSA, Society for Industrial and Applied Mathematics, and General Systems Research.

Harold Greenberg ("A Branch Search Algorithm for the Knapsack Problem") is a Professor of Operations Research at the Naval Postgraduate School. He received a Ph.D. from New York University. His publications in the areas of integer programming, linear programming, inventory analysis, and traffic theory have appeared in journals such as *Journal of Mathematical Analysis and Application*, *Operations Research*, *Naval Research Logistics Quarterly*. The author is currently working on a book on mathematical programming. He comments that the type of procedure in the paper is being used by the author to solve general integer programs.

Harvey J. Greenberg ("Symmetric Mathematical Programs") is an Associate Professor at the Computer Science Center of Southern Methodist University. He received a B.S. from the University of Miami in Florida in 1962 and a Ph.D. from Johns Hopkins University in 1967. He was previously employed as a reliability engineer by North American Aviation, Canoga Park, California; as a systems engineer, by the Martin Company in Baltimore; as a systems defense engineer by Westinghouse Defense Center, in Baltimore; and as a teaching assistant by Johns Hopkins University, also in Baltimore. Dr. Greenberg's recent publications include: "The Use of Branching in Dynamic Programming for Parametric Analysis," *Operations Research*, Vol. 15, no. 5, September-October 1967; "Dynamic Programming with Linear Uncertainties," *Operations Research*, Vol. 16, No. 3, May-June, 1968; and "Searching Everett's Lagrange Multipliers," *SMU Tech. Memo*, No. CP-69008, 1969. His primary field of interest is non-linear programming; he is also engaged in research in algorithmic analysis. The author is a member of ORSA, TIMS, Society for Industrial and Applied Mathematics, Tau Beta Pi Mu Epsilon, and AMS.

Carl M. Harris ("Some Results for Bulk-Arrival Queues with State-Dependent Service Times") is a member of the technical staff of the Advanced Research Department of the Research Analysis Corporation in McLean, Virginia. He received the B.S. degree in mathematics from Queens College in 1960, and the M.S. and Ph.D. degrees, also in mathematics, from the Polytechnic Institute of Brooklyn in

1962 and 1966, respectively. His current research interests include statistical analysis of semi-Markov processes (particularly as related to queuing), inventory control, and reliability. Dr. Harris is author of articles in *Journal of Industrial Engineering*, *Operations Research*, *Naval Research Logistics Quarterly*, and *IEEE Transactions on Reliability*. Dr. Harris says about the present paper, "This work is the result of my desire to extend some of my earlier work, notably that for my dissertation, to a larger class of problems, while at the same time not being restricted by a lack of closed-form results. All too often the applied worker becomes frustrated with transform solutions, for example, and finds that the developed theory has little or no practical value."

Robert L. Hegerich ("A Branch Search Algorithm for the Knapsack Problem") is a Captain in the U. S. Army. He received an M.S. in operations research from the Naval Postgraduate School and a B.S. in electrical Engineering from Northeastern University. The author is presently on active duty.

William L. Maxwell ("On Sequencing n Jobs on One Machine to Minimize the Number of Late Jobs") is a Professor in the Department of Operations Research at Cornell University. The author received a B.M.E. in mechanical engineering and a Ph.D. in industrial engineering from Cornell University. The author taught one year at the University of Chicago Graduate School of Business on sabbatical leave from Cornell. The author has published several papers in *Operations Research*, *Management Science*, *Naval Research Logistics Quarterly*, and *AIIE*. Dr. Maxwell's present research is in the fields of scheduling and instructional computing languages. He is a member of *AIIE*, *ORSA*, *TIMS*, and *ACM*.

Raymond K. Mueller ("A Method for Solving the Indefinite Quadratic Programming Problem") is employed by Bell Telephone Laboratories. He received the B.S., M.S. and D.Sc. degrees in applied mathematics and operations research from Washington University in St. Louis, Missouri. He has published "A Comparison of the Primal-Simplex and Primal-Dual Methods for Linear Programming," *Comm. ACM*, November 1965. He is currently interested in stochastic processes and information theory. Dr. Mueller is a member of *Tau Beta Pi*, and *Sigma Xi*.

William P. Pierskalla ("Symmetric Mathematical Programs") is an Associate Professor at the Computer Sciences Center of Southern Methodist University. He received the A.B. degree in economics and the M.B.A. degree in business from Harvard University in 1956 and 1958, respectively; he also received the M.S. degree in mathematics from the University of

Pittsburgh in 1962 and the Ph.D. degree in operations research from Stanford University in 1965. Dr. Pierskalla was previously employed by the Westinghouse Electric Corporation in Pittsburgh, by the Stanford Research Institute as a mathematical statistician, and by Case Western Reserve University as an Assistant and Associate Professor. His recent publications include: "The Multi-Dimensional Assignment Problem," *Operations Research*, Vol. 16, No. 2 (March-April 1968); "Mathematical Programming with Increasing Constraint Functions," *Management Science*, Vol. 15 (March 1969); and "An Inventory Problem with Obsolescence," *Naval Research Logistics Quarterly*, Vol. 16 (June 1969). Dr. Pierskalla's primary fields of interest are inventory and production control and linear and nonlinear optimization. He is engaged in research in the fields of algorithms for solving multi-dimensional assignment problems, nonlinear mathematical programming, and perishable inventory problems. The author is a member of *TIMS*, *ORSA*, *ACM*, *Society for Industrial and Applied Mathematics*, and *Sigma Xi*.

J. H. Portillo-Campbell ("A Fractile Approach to Linear Programming Under Risk"), Associate Professor of Computer Science at the Universidad Nacional de Ingenieria in Lima, Peru, is currently on leave as a Ph.D. candidate in econometrics at Iowa State University. He received a B.S. in mechanical engineering from the Universidad Nacional de Ingenieria in Lima, Peru and a M.S. in economics from Iowa State University. His present research interest is in mathematical programming and simulation; in the past he researched programming languages. He is a member of *TIMS*, *ORSA*, *Econometric Society*, and *A. C. M.*

Philip D. Robers ("A Decomposition Method for Interval Linear Programming") is a member of the Technical Staff of the Advanced Research Department, Research Analysis Corporation, McLean, Virginia. He was awarded the B. S. degree in engineering science and the M.S. degree in applied mathematics, both from Washington University; and the Ph.D. degree in operations research from Northwestern University. Dr. Robers has authored "On Generalized Inverses and Interval Linear Programming" (with A. Ben-Israel and A. Charnes) in *Theory and Applications of Generalized Inverses of Matrices: Symposium Proceedings*, Texas Technological College, Mathematics Series No. 4, Lubbock, Texas, March 1968; "An Interval Programming Algorithm for Discrete Linear L_1 Approximation Problems" (with A. Ben-Israel), *Journal of Approximation*, (forthcoming); "Interval Programming: A New Approach to Linear Programming with Applications to Chemical Engineering Problems" (with A. Ben-Israel), *Industrial and Engineering Chemistry Process*

Design and Development Quarterly, (forthcoming); and "On the Explicit Solution of a Special Class of Linear Economic Models" (with A. Ben-Israel, A. Charnes, and A. Hurter), *Operations Research* (forthcoming). The author's research interests are theory and applications of linear and nonlinear programming, techniques for solving facility location problems, and convergent sequences of sets and programming problems. The author states: "Interval linear programming seems to be a useful approach for solving certain classes of linear programming problems. I would be interested in communicating with people that obtain computational experience using this approach." He is a member of TIMS and ORSA.

A. H. Russell ("Cash Flows in Networks") is a Senior Lecturer at the Graduate Business Centre of the City University in London and a consultant to various firms on the use of computers in construction industry and the use of statistics and operations research techniques in the analysis of financial data. He received the B.Sc. degree in mathematics from Kings College of London University. The author was an Operations Research Analyst for the United Steel Company; a Senior Scientific Officer for the U.K. A.E.A.; and a Senior Scientific Officer for the Building Research Station. He has published "Investment Uncertainty and British Equities," *Investment Analyst*, (December 1968) which was written jointly with B. Taylor. In the past, most of his research centered in field of applications of and extensions to operations research techniques; he now does research on statistical and operations research techniques applied to financial data, e. g. stock market prices. He is also helping to establish a data bank on U.K. equity prices at the City University. Mr Russell is a Fellow of the Royal Statistical Society and a member of the Operational Research Society.

David P. Rutenberg ("Generalized Networks, Generalized Upper Bounding and Decomposition of the Convex Simplex Method") is an Assistant Professor of Industrial Administration at Carnegie-Mellon University in Pittsburgh and a Consultant to Westinghouse Electric Corporation. He received the B. A. Sc. degree in engineering physics from the University of Toronto in 1961; and the M. B. A. and Ph.D. degrees in business administration from the University of California at Berkeley in 1964 and 1967, respectively. Previously, Dr. Rutenberg was an Operations Research Engineer with Chevron Research (Standard Oil of California). He has published "Planning for Multi-National Synergy" in *Long Range Planning* and, in addition, has had several other articles accepted for publication. Presently he is researching the development of models for planning in multi-national companies. The author is a member of TIMS,

ORSA, Econometric Society, and the Association for Education in International Business.

J. K. Sengupta ("A Fractile Approach to Linear Programming Under Risk") is a Professor of Economics and Statistics at Iowa State University. He received the B.S. degree in economics with mathematics and the M.S. degree in economics with statistics from the University of Calcutta in India and the Ph.D. degree in econometrics from Iowa State University. Formerly, he was a Professor at the Indian Institute of Management in Calcutta. He has authored over 30 papers, which have appeared in publications such as *Econometrica*, *Operations Research*, *Management Science*, *International Economic Review*, and *Economica*, including: "Safety-First Rules Under Chance-Constrained Linear Programming," *Operations Research*, vol. 17, no. 1, 1969; and "The Stability of Truncated Solutions of Stochastic Linear Programming," *Econometrica*, vol. 34, 1966. He has recently co-authored a book: *Economic Analysis and Operations Research: Optimization Techniques in Quantitative Economic Models* (North-Holland Publishing Company, Amsterdam, 1969). He is an Associate Editor of the *International Economic Review* and a member of the Econometric Society and Phi Kappa Phi.

Matthew J. Sobel ("Employment Smoothing (Capital Accumulation) with Production for Stochastic Demand") is an Assistant Professor of Administrative Sciences at Yale University and an Associate Editor of *Management Science*. The author received the A.B. degree from Columbia College in 1959; the B.S. degree in industrial engineering in 1960 and the A.M. degree in mathematical statistics in 1964, both from Columbia University; and the Ph.D. degree in operations research from Stanford University in 1967. Formerly, he was employed by Western Electric Company Headquarters O.R. Group, the U. S. Public Health Service in the division that became the Federal Water Pollution Control Administration in the Department of the Interior, and the Industrial O. R. Group of Stanford Research Institute. Dr. Sobel's papers have appeared in *Management Science*, *Operations Research*, *Water Resources Research*, *Journal of the Water Pollution Control Federation*, and *Journal of the Sanitary Engineering Division of the American Society of Civil Engineers*. His current research interests are normative queuing models, stochastic games, water resources, and inventory and production theory.

Robert Wilson ("Integer Programming via Modular Representations") is an Associate Professor at Stanford University. In 1963, he received a D.B.A. degree in managerial economics from Harvard University. His present research includes the field of game theory.
