With 12,500 members from nearly 90 countries, INFORMS is the largest international association of operations research (O.R.) and analytics professionals and students. INFORMS provides unique networking and learning opportunities for individual professionals, and organizations of all types and sizes, to better understand and use O.R. and analytics tools and methods to transform strategic visions and achieve better outcomes. For more information on INFORMS, its publications, membership, or meetings visit <http://www.informs.org>

Contributors

David L. Alderson (“Catching the ‘Network Science’ Bug: Insight and Opportunity for the Operations Researcher”) is an assistant professor in the Operations Research Department at the Naval Postgraduate School. He joined the faculty in 2006 after working for three years as a postdoctoral scholar in the Division of Engineering and Applied Sciences at the California Institute of Technology (Caltech). He received a B.S.E. in civil engineering and operations research from Princeton University and the M.S. and Ph.D. degrees from the Department of Management Science and Engineering at Stanford University. His research interests include the modeling and analysis of infrastructure networks, particularly the Internet. He has extensive experience working on complex communication networks, having been a researcher at the Xerox Palo Alto Research Center (PARC), the Santa Fe Institute (SFI), and the Institute for Pure and Applied Mathematics (IPAM) at UCLA.

Tarik Aouam (“Regulation of Natural Gas Distribution Using Policy Benchmarks”) is an assistant professor with the School of Business Administration at Al Akhawayn University in Ifrane, Morocco. His current teaching and research are in optimization modeling and algorithms, especially their application to energy markets, finance, and supply chain management.

Goker Aydin (“Joint Inventory and Pricing Decisions for an Assortment”) is an assistant professor in the Department of Industrial and Operations Engineering at the University of Michigan. His current research focuses on the interaction between operations management and marketing decisions. This paper reflects his interest in pricing decisions in the presence of inventory considerations.

Manel Baucells (“Cumulative Dominance and Heuristic Performance in Binary Multiattribute Choice”) is associate professor and head of the Managerial Decision Sciences Department at IESE Business School. His main research interests cover both normative and descriptive aspects of decision making. He is a council member of the Decision Analysis Society and associate editor of the journals *Management Science*, *Operations Research*, *Decisions Analysis*, and *Theory and Decision*.

Emre Berk (“Analysis of the (Q, r) Inventory Model for Perishables with Positive Lead Times and Lost Sales”) is an associate professor, Faculty of Business Administration, Bilkent University, Turkey. This work is part of a research stream conducted with others, partially funded by TUBITAK grant MISAG-104. It has been motivated by observations about industrial practices and examination of the related inventory literature.

Luce Brotcorne (“Joint Design and Pricing on a Network”) is an associate professor. A graduate of Université Libre de Bruxelles (Ph.D., 1998), she teaches at Université de Valenciennes et du Hainaut Cambrésis (France). Her main research interests lie in the fields of bilevel programming and revenue management.

Derek W. Bunn (“Modeling the Impact of Market Interventions on the Strategic Evolution of Electricity Markets”) is a professor at London Business School, having held previous appointments at Stanford and Oxford. He is chief editor of the *Journal of Forecasting*, a previous chief editor of *Energy Economics*, and has been on the editorial boards of 10 other journals, including *Management Science*.

Juan A. Carrasco (“Cumulative Dominance and Heuristic Performance in Binary Multiattribute Choice”) is an associate professor at the Electronics Engineering Department of Universitat Politècnica de Catalunya. His research interests include dependability and performability modeling of fault-tolerant systems and applications of Markov models. He has led the design and implementation of the MET-FAC Markovian dependability and performability modeling tool (<http://dit.upc.es/qine/tools/metfac>). He is a Senior member of IEEE.

Wai Kin (Victor) Chan (“Optimization Models of Discrete-Event System Dynamics”) is an assistant professor in the Department of Decision Sciences and Engineering Systems at the Rensselaer Polytechnic Institute. He received a B.Eng. and an M.Eng. in electrical engineering from Shanghai Jiao Tong University and Tsinghua University, respectively. He also earned an M.S. and a Ph.D. in industrial engineering and operations research from University of California, Berkeley in 2001 and 2005, respectively. His research interests include discrete-event simulation, agent-based simulation, mathematical programming, and their applications in energy markets, social networks, service systems, and manufacturing.

Raymond K. Cheung (“Distribution Coordination Between Suppliers and Customers with a Consolidation Center”) is a professor in the Department of Industrial Engineering and Logistics Management at Hong Kong University of Science and Technology. He received his B.S. (1984) degree in applied computational and mathematical science and M.A. (1985) degree in applied mathematics from York University, Canada, and his M.A. (1989) and Ph.D. (1993) in civil engineering and operations research from Princeton University. He was the recipient of the first George Dantzig prize for the best dissertation in operations research and the management sciences. His current research

focuses on transportation systems management, network modeling and optimization, and stochastic and dynamic optimization.

Wade D. Cook (“The DEA Game Cross-Efficiency Model and Its Nash Equilibrium”) is the Gordon Charlton Professor of Management Science at the Schulich School of Business, York University, Toronto, Canada. His research interests lie in the areas of DEA, and multicriteria decision modeling.

Frank J. Fabozzi (“Assisting Defined-Benefit Pension Plans”) is a professor in the practice of finance at the School of Management, Yale University.

Yuyi Feng (“A Risk-Sensitive Model for Managing Perishable Products”) is an associate professor at the Systems Engineering and Engineering Management Department, The Chinese University of Hong Kong. His research interests include revenue management, supply chain management, and service management.

Paul Glasserman (“Fast Simulation of Multifactor Portfolio Credit Risk”) is the Jack R. Anderson Professor at Columbia Business School. His research focuses on modeling and computational problems in derivatives pricing and risk management. His book, *Monte Carlo Methods in Financial Engineering* (Springer 2004), received the 2005 Outstanding Simulation Publication Award and the 2006 Lanchester Prize.

Yongpei Guan (“Polynomial-Time Algorithms for Stochastic Uncapacitated Lot-Sizing Problems”) is an assistant professor in the School of Industrial Engineering at the University of Oklahoma. He obtained his Ph.D. from Georgia Institute of Technology in 2005. His research interests include stochastic integer programming and decision making under uncertainty with applications in power asset optimization, logistics, and supply chain management. This is the first paper derived from his National Science Foundation-sponsored project entitled “Polyhedral Combinatorics and Algorithms for Stochastic Integer Programming.”

Ülkü Gürler (“Analysis of the (Q, r) Inventory Model for Perishables with Positive Lead Times and Lost Sales”) is a professor in the Department of Industrial Engineering, Faculty of Engineering, Bilkent University, Turkey.

Robin M. Hogarth (“Cumulative Dominance and Heuristic Performance in Binary Multiattribute Choice”) is an ICREA Research Professor at Universitat Pompeu Fabra, Barcelona, Spain. His main research interests lie in the psychology of judgment and decision making to which he has made many contributions over several decades. His current interests focus on developing theories that predict when simple rules for decision making do and do not perform well. He is also fascinated by the topic of intuition (*Educating Intuition*, The University of Chicago Press 2001). He is a past president of the Society for Judgment and Decision Making and is currently president of the European Association for Decision Making.

Vernon N. Hsu (“Distribution Coordination Between Suppliers and Customers with a Consolidation Center”) is a professor and the Chair of the Information Systems & Operations Management Area in the School of Management at George Mason University. He received his Ph.D. in operations management from the University of Iowa in 1993. His current research focuses on the management of global supply chains, and the analysis and design of logistics systems and other service systems. He is a member of IIE, INFORMS, and POMS.

Boray Huang (“A Make-to-Stock System with Multiple Customer Classes and Batch Ordering”) is with the Department of Industrial and Systems Engineering, National University of Singapore. Previously he was an assistant professor in the School of Business Administration, The University of Mississippi. He received his Ph.D. degree from Northwestern University. His research interests include supply chain management, stochastic optimization, and marketing-production coordination.

Seyed M. R. Iravani (“A Make-to-Stock System with Multiple Customer Classes and Batch Ordering”) is an associate professor in the Department of Industrial Engineering and Management Sciences, Northwestern University. His research interests are in the design and control of production, supply chains, and service operations systems.

Victor Richmond R. Jose (“Scoring Rules, Generalized Entropy, and Utility Maximization”) is a Ph.D. student in the Decision Sciences Group at the Fuqua School of Business, Duke University. His main research interests lie in decision analysis and the use of Bayesian statistical methods in management science, operations research, and risk analysis.

Wanmo Kang (“Fast Simulation of Multifactor Portfolio Credit Risk”) is an assistant professor in the Department of Mathematical Sciences at Korea Advanced Institute of Science and Technology (KAIST). He earned his Ph.D. in operations research from Columbia University in 2005. He is interested in applied probability and operations research with applications to finance.

Martine Labbé (“Joint Design and Pricing on a Network”) specializes in network and combinatorial optimization. She is currently Dean of the Faculty of Sciences at ULB (Université Libre de Bruxelles). Her interest in bilevel programming was triggered by a network pricing application, which led to the design extension considered in this issue.

Retsef Levi (“Approximation Algorithms for Capacitated Stochastic Inventory Control Models”) is the Robert N. Noyce Career Development Professor, Assistant Professor of Management at the Sloan School of Management, MIT. Previously he spent a year in the Department of Mathematical Sciences at the IBM T. J. Watson Research Center as the holder of the Goldstine Postdoctoral Fellowship. He received a bachelor’s degree in mathematics from Tel Aviv University (Israel) in 2001, and a Ph.D. in operations research from Cornell University in 2005. His current

research is focused on the design and the performance analysis of efficient algorithms for stochastic and deterministic optimization models arising in the context of supply chains, revenue management, logistics, and health-care management.

Liang Liang (“The DEA Game Cross-Efficiency Model and Its Nash Equilibrium”) is a professor at the Management School, University of Science and Technology of China. His main research interests are decision science and supply chain theory and practice.

Patrice Marcotte (“Joint Design and Pricing on a Network”) is professor at the Département d’Informatique et de Recherche Opérationnelle of the Université de Montréal. His research interests range from bilevel programming and variational inequalities to network design and pricing. The genesis of the current paper can be traced back to a sabbatical year spent at Université de Bruxelles, where informal discussions with Martine Labbé and Gilles Savard led to the formulation and analysis of pricing problems cast within the framework of bilevel programming.

Andrew J. Miller (“Polynomial-Time Algorithms for Stochastic Uncapacitated Lot-Sizing Problems”) is an assistant professor of industrial and systems engineering at the University of Wisconsin–Madison. He received a Ph.D. in industrial and systems engineering from Georgia Institute of Technology in 1999 and was a visiting research fellow at the Center for Operations Research and Econometrics in Louvain-la-Neuve, Belgium from September 1999 to December 2001. His research now encompasses theoretical areas such as stochastic integer programming and MIP decomposition methods, application areas ranging from supply chain design to health-care delivery, and computational challenges such as how best to implement MIP problems via massively parallel or grid computing frameworks.

Alp Muharremoglu (“A Single-Unit Decomposition Approach to Multiechelon Inventory Systems”) is an assistant professor of decision, risk, and operations at the Columbia University Graduate School of Business. He received his Ph.D. in operations research from MIT. His research interest is decision making under uncertainty, with a focus on supply chain management and revenue management.

John M. Mulvey (“Assisting Defined-Benefit Pension Plans”) is a professor in the Department of Operations Research and Financial Engineering, Bendheim Center for Finance, Princeton University. He has implemented ALM systems for pension trusts since the mid-1980s. Examples include PIMCO (1986–1993) and Towers Perrin (1990 to present). These stochastic programs can protect the plan’s surplus and at the same time provide superior asset returns by taking advantage of volatility and related market dynamics. Operations research methods are ideally suited to addressing these important societal problems.

Kumar Muthuraman (“Regulation of Natural Gas Distribution Using Policy Benchmarks”) is an assistant professor with the McCombs School of Business at the University of Texas at Austin. His current research interests focus

on stochastic control and its applications in mathematical finance, energy markets, and operations management.

Robert F. Nau (“Scoring Rules, Generalized Entropy, and Utility Maximization”) is a professor in the Fuqua School of Business at Duke University. His research interests center on the use of duality arguments in various branches of rational choice theory, and in particular on the role of no-arbitrage as the fundamental principle of rationality that unifies the theories of decision-making under uncertainty, noncooperative games, and competitive markets.

Fernando S. Oliveira (“Modeling the Impact of Market Interventions on the Strategic Evolution of Electricity Markets”) is assistant professor of operational research and management sciences at Warwick Business School, and associate researcher at CEMPRE, Universidade do Porto. He holds a Ph.D. from London Business School, and an M.Sc. in artificial intelligence and computing, and a licenciatura in economics, both from Universidade do Porto.

William R. Pauling (“Assisting Defined-Benefit Pension Plans”) is a risk manager at Hartford Investment Management Company.

Erica L. Plambeck (“Asymptotically Optimal Control for an Assemble-to-Order System with Capacitated Component Production and Fixed Transport Costs”) is an associate professor of operations, information, and technology at the Stanford Graduate School of Business. Her paper is one in a series on assemble-to-order manufacturing, originally motivated by a consulting project with Sun Microsystems.

Evan L. Porteus (“Joint Inventory and Pricing Decisions for an Assortment”) is the Sanwa Bank Professor of Management Science at the Stanford Graduate School of Business. He was a Fulbright-Hays Senior Research Fellow in 1976–1977 in Australia. He is the author of *Foundations of Stochastic Inventory Theory*. His research focuses on supply chain management.

Ronald Rardin (“Regulation of Natural Gas Distribution Using Policy Benchmarks”) is John and Mary Lib White Systems Integration Chair, Distinguished Professor and Interim Department Head of Industrial Engineering at the University of Arkansas–Fayetteville. He also heads the university’s new Center on Innovation in Healthcare Logistics targeting innovations in supply chain and material flow aspects of health-care operations in collaboration with Wal-Mart, Blue Cross Blue Shield, and other partners. His current teaching and research interests center on large-scale optimization modeling and algorithms, especially their applications in health-care delivery and energy planning.

Robin O. Roundy (“Approximation Algorithms for Capacitated Stochastic Inventory Control Models”) holds bachelor’s and master’s degrees in mathematics from Brigham Young University and a doctoral degree in operations research from Stanford University. He joined the faculty of the School of Operations Research and Industrial Engineering at Cornell University in 1983. He won the Nicholson Student Paper Competition and received a

Presidential Young Investigator Award from the National Science Foundation and the Fredrick W. Lanchester Prize from the Operations Research Society of America. He is a two-time recipient of the S. Yau 1972 Excellence in Teaching Award, and has received other teaching and research awards. He is a member of INFORMS, IIE, and INCOSE.

Scott E. Sampson (“Optimization of Vacation Timeshare Scheduling”) is a professor at Brigham Young University. For many years he has studied optimized scheduling in service settings such as class scheduling, conference scheduling, and volunteer scheduling. When a friend suggested he consider purchasing a vacation timeshare, he discovered a prime opportunity for optimized scheduling, namely, timeshare exchanges. Now, with a push of the “optimize” button, hundreds of people are sent around the world to preferred vacations they otherwise would not be able to access.

Gilles Savard (“Joint Design and Pricing on a Network”) is director of research and innovation at École Polytechnique (Montréal). His research focuses on the theory and practice of nonconvex optimization in general and bilevel programming in particular, with applications in the field of pricing and revenue management.

Lee Schruben (“Optimization Models of Discrete-Event System Dynamics”) is a professor in the Department of Industrial Engineering and Operations Research at the University of California at Berkeley. Prior to joining the Berkeley faculty, he was on the operations research and industrial engineering faculty at Cornell University, where he held the A. Schultz Professorship in Engineering. He received his Ph.D. from Yale and is a Fellow of the Institute for Operations Research and the Management Sciences. His research interests are in simulation modeling and analysis methodologies with a broad range of applications most recently focusing on biopharmaceutical production and supply chains.

Perwez Shahabuddin (“Fast Simulation of Multifactor Portfolio Credit Risk”). Prior to his death in November 2005, Perwez Shahabuddin was a professor in the Department of Industrial Engineering and Operations Research, Columbia University. He had worked extensively on problems of rare-event simulation in many application areas, including computer reliability, telecommunications, insurance risk, and finance, earning several awards for his research in this field.

David B. Shmoys (“Approximation Algorithms for Capacitated Stochastic Inventory Control Models”) is a professor in the School of Operations Research and Information Engineering and in the Department of Computer Science at Cornell University. His research has focused on the design and analysis of efficient approximation algorithms for optimization problems, with the goal of proving worst-case performance guarantees on the quality of the solutions found. This paper is part of a recent thread of research that extends this viewpoint to computing provably good solutions to computationally hard stochastic optimization problems.

Koray D. Simsek (“Assisting Defined-Benefit Pension Plans”) is an assistant professor of Finance at Sabanci Uni-

versity, Faculty of Management. He has been using operations research techniques to tackle long-term financial planning problems since he was a doctoral student at Princeton University. Difficulties faced by the defined-benefit pension systems worldwide have created a natural playground for this line of research. This paper belongs to a larger body of his research in asset-liability management.

Haiqing Song (“Distribution Coordination Between Suppliers and Customers with a Consolidation Center”) is an assistant professor in the Lingnan (University) College, Sun Yat-Sen University, China. He received his Ph.D. in industrial engineering and engineering management from Hong Kong University of Science and Technology in 2005. He was the recipient of the Doctoral Dissertation Award from the Council of Supply Chain Management Professionals. His current research focuses on supply chain network modeling and optimization, dynamic routing, and stochastic network optimization.

Van Anh Truong (“Approximation Algorithms for Capacitated Stochastic Inventory Control Models”) received a Ph.D. in operations research from Cornell University in 2007. Her interests are in stochastic approximations and optimization. She has published in *Mathematical Programming* and *Operations Research*.

John N. Tsitsiklis (“A Single-Unit Decomposition Approach to Multiechelon Inventory Systems”) is a Clarence J. Lebel Professor of Electrical Engineering, with the Department of Electrical Engineering and Computer Science at MIT. He has served as acting codirector of the Laboratory for Information and Decision Systems (Spring 1996 and 1997), and as a codirector of the Operations Research Center (2002–2005) at MIT. His research interests are in the fields of systems, optimization, control, and operations research, and he has coauthored more than 100 journal papers in these areas. He is a Fellow of IEEE and INFORMS, and a member of the National Academy of Engineering.

Robert L. Winkler (“Scoring Rules, Generalized Entropy, and Utility Maximization”) is James B. Duke Professor in the Fuqua School of Business at Duke University and also holds an appointment in the Department of Statistical Science at Duke. His primary research areas include decision analysis, Bayesian statistics, probability forecasting, competitive decision making, and risk analysis.

Jie Wu (“The DEA Game Cross-Efficiency Model and Its Nash Equilibrium”) is a Ph.D. candidate in the Management School at the University of Science and Technology of China, Hefei, Anhui province. His current research interests include data envelopment analysis (DEA), decision analysis, and game theory.

Baichun Xiao (“A Risk-Sensitive Model for Managing Perishable Products”) is a senior professor and chairman of the Management Department at Long Island University, C.W. Post. His research interests include revenue management, service management, and optimization.

Zhuojuan Zhang (“Assisting Defined-Benefit Pension Plans”) is an associate at Black Rock Financial Management Inc. Part of the research for the article in this issue was conducted during a project on evaluating existing defined benefit policies with the U.S. Department of Labor, motivated by the growing concern about the financial health of the defined-benefit pension system in the United States. He was a Ph.D. student at the Department of Operations Research and Financial Engineering at Princeton University during the early stages of this research.

Joe Zhu (“The DEA Game Cross-Efficiency Model and Its Nash Equilibrium”) is an associate professor at the Department of Management, Worcester Polytechnic Institute. His current research has been concentrated in quantitative models in performance evaluation and benchmarking.

Paul Zipkin (“Old and New Methods for Lost-Sales Inventory Systems”) is the R. J. Reynolds Professor of Business at the Fuqua School of Business, Duke University. This paper continues his long-standing interest in understanding inventory systems and supply chains.
