With 12,500 members from nearly 90 countries, INFORMS is the largest international association of operations research (O.R.) and analytics professionals and students. INFORMS provides unique networking and learning opportunities for individual professionals, and organizations of all types and sizes, to better understand and use O.R. and analytics tools and methods to transform strategic visions and achieve better outcomes. For more information on INFORMS, its publications, membership, or meetings visit <http://www.informs.org>

Contributors

Richa Agarwal (“Network Design and Allocation Mechanisms for Carrier Alliances in Liner Shipping”) is a research scientist at Amazon.com. She received her Ph.D. in algorithms, combinatorics, and optimization from Georgia Institute of Technology in 2007. Her research interests span integer programming, network optimization, combinatorial optimization, and algorithmic game theory. She has recently focused on design of large-scale networks and management of decentralized systems.

Ravindra K. Ahuja (“Fast Algorithms for Specially Structured Minimum Cost Flow Problems with Applications”) is a professor in industrial and systems engineering at the University of Florida. He conducts research in the theory and application of network optimization and publishes widely in prestigious journals. He is a winner of the INFORMS 1993 Lanchester Prize, 2004 Pierskalla Award, 2006 Wagner Prize, and 2007 Koopman Award. He is an associate editor for the journals *Operations Research*, *Transportation Science*, and *Networks*.

Oguzhan Alagoz (“Optimal Breast Biopsy Decision-Making Based on Mammographic Features and Demographic Factors”) is an assistant professor of industrial and systems engineering at the University of Wisconsin–Madison. His research interests include medical decision making, completely and partially observable Markov decision processes, discrete-event system simulation, health-care applications, and risk-prediction models.

Alfredo Altuzarra (“Consensus Building in AHP-Group Decision Making: A Bayesian Approach”) is an associate professor in statistics and operations research of the Faculty of Economics at the University of Zaragoza. He received his Ph.D. in mathematics in 2005. His current research interests include decision theory, Bayesian inference, analytic hierarchy process, and multicriteria decision making with applications to economics and business.

Hamsa Balakrishnan (“Algorithms for Scheduling Runway Operations Under Constrained Position Shifting”) is the T. Wilson Career Development Assistant Professor of Aeronautics and Astronautics at the Massachusetts Institute of Technology (MIT). She received a B.Tech. in aerospace engineering from the Indian Institute of Technology, Madras, and a Ph.D. in aeronautics and astronautics from Stanford University. Prior to joining MIT, she was a researcher at the University of California, Santa Cruz, and the NASA Ames Research Center. She was the recipient

of an NSF CAREER Award in 2008. Her research interests address various aspects of air transportation systems, including algorithms for air traffic scheduling and routing, air traffic surveillance algorithms, and mechanisms for the allocation of airport and airspace resources.

Marco Antonio Boschetti (“An Exact Algorithm for the Two-Dimensional Strip-Packing Problem”) is a researcher at the Department of Mathematics of the University of Bologna, Italy. He received his Ph.D. in operational research from the Business School of Imperial College, London, in 1999, and joined the faculty of the University of Bologna in 2002. His main research interest is the development of exact and heuristic algorithms for the solution of real-world problems, in particular logistics problems.

Elizabeth S. Burnside (“Optimal Breast Biopsy Decision-Making Based on Mammographic Features and Demographic Factors”) is an associate professor and the vice chair of research in the Department of Radiology at the University of Wisconsin School of Medicine and Public Health. She received her M.D. degree combined with a master’s in public health followed by a master’s degree in medical informatics from Stanford University in the midst of her medical training. As a result, her research investigates the use of artificial intelligence methods to improve decision-making in the domain of breast imaging. She was elected a Fellow in the Society of Breast Imaging in 2004.

Abel Cadenillas (“Optimal Control of a Mean-Reverting Inventory”) is professor in the Department of Finance and Management Science and the Department of Mathematical and Statistical Sciences of the University of Alberta. He received his Ph.D. in statistics from Columbia University. He recently became World Class University Distinguished Professor of Financial Engineering at Ajou University (awarded by the Korean Ministry of Education, Science and Technology). He is an associate editor of *Mathematics and Financial Economics*. His research interests include operations research, management sciences, finance, economics, and mathematics. His work has been published in the *Journal of Financial Economics*, the *Journal of Economic Theory*, *Mathematical Finance*, *SIAM Journal on Control and Optimization*, the *Journal of Finance and Stochastics*, and other journals.

Bala G. Chandran (“Algorithms for Scheduling Runway Operations Under Constrained Position Shifting”) is a consultant at Analytics Operations Engineering, Inc. in Boston,

Massachusetts. He received his Ph.D. from the Department of Industrial Engineering and Operations Research at the University of California, Berkeley, in April 2007. His research interests lie in combinatorial optimization and in algorithm development and implementation.

Jagpreet Chhatwal (“Optimal Breast Biopsy Decision-Making Based on Mammographic Features and Demographic Factors”) is a health economist at Merck Research Laboratories. His research interests include sequential decision making under uncertainty, medical decision making, and health economics. He received his Ph.D. in industrial engineering from the University of Wisconsin–Madison in 2008. His dissertation was awarded second place in the George B. Dantzig Dissertation Award competition in 2009. This work also earned for him the best student paper awards from the Decision Analysis Society, and the Manufacturing and Service Operations Management Society.

Gregory Dobson (“A Model of ICU Bumping”) is an associate professor of operations management at the Simon School of Business, University of Rochester. He holds a B.S. in operations research and industrial engineering from Cornell University and a Ph.D. in operations research from Stanford University. His current work concentrates on the application of process improvement principles, in particular Six Sigma, to health care and other industries.

Özlem Ergun (“Network Design and Allocation Mechanisms for Carrier Alliances in Liner Shipping”) is an associate professor in the School of Industrial and Systems Engineering at the Georgia Institute of Technology. She is also a cofounder and codirector of the Humanitarian Logistics Research Center at the Supply Chain and Logistics Institute at Georgia Tech. Her research focuses on the design and management of large-scale networks. Specifically, she studies logistics and communications networks that are dynamic and partially decentralized. She has recently focused on understanding how collaboration among different entities can help them to be more efficient and create value for the overall system. She has applied her work on network design, management, and collaboration to problems arising in the airline, ocean cargo, and trucking industries. Recently she has taken a leadership role in promoting the use of systems thinking and mathematical modeling in applications with societal impact within the INFORMS community. As codirector of the Center for Humanitarian Logistics at Georgia Tech, she has worked with organizations that respond to humanitarian crises around the world, including the United Nations World Food Programme, CARE USA, FEMA, USACE, CDC, AFCEMA, and MedShare International.

Finn R. Førsund (“Differential Characteristics of Efficient Frontiers in Data Envelopment Analysis”) is a professor at the University of Oslo, Department of Economics, where he received his doctor philosophie degree in 1983

based on production theory and efficiency analyses. His main research interests are within the fields of environmental economics, energy economics, production theory, and productivity and efficiency. He has published extensively in international journals. He is a scientific advisor to the Ragnar Frisch Centre for Economic Research in Oslo.

Robert Fourer (“Optimization Services: A Framework for Distributed Optimization”) is professor of industrial engineering and management sciences at Northwestern University. He has a long-standing research interest in computer systems for the support of optimization and was one of the creators of the AMPL modeling language.

Banu Gemici-Ozkan (“R&D Project Portfolio Analysis for the Semiconductor Industry”) is a revenue management science analyst in the Department of Revenue Management at Carnival Cruise Lines. She received her M.S. degree in management science (2004) and Ph.D. degree in operations research (2009), both from Lehigh University. Her main research interests are applying adaptive forecasting techniques as a part of large decision systems and optimization models.

Paul Glasserman (“Sensitivity Estimates from Characteristic Functions”) is the Jack R. Anderson Professor of Business at Columbia Business School. He has held visiting positions at Princeton University, New York University, and the Federal Reserve Bank of New York. His research interests include stochastic modeling, simulation, derivative securities, and risk management.

Nicholas G. Hall (“Capacity Allocation and Scheduling in Supply Chains”) is a professor of operations management at the Fisher College of Business, the Ohio State University. He received B.A. and M.A. degrees from the University of Cambridge and a Ph.D. degree from the University of California, Berkeley. His research interests include supply chain optimization problems, modern manufacturing and scheduling, project management, and applications of operations research. He has served as president of the Manufacturing and Service Operations Management Society and as a vice president of INFORMS. He is the owner of a consulting company, CDOR, based in Dublin, Ohio, that provides decision support solutions to businesses and local government. This paper is one of several studies with his former Ph.D. student Zhixin Liu about how to promote coordination among agents within supply chain optimization problems.

Peter Lakner (“Optimal Control of a Mean-Reverting Inventory”) is associate professor in the Information, Operations and Management Sciences Department of New York University, Stern School of Business. He received his Ph.D. in statistics from Columbia University and an M.A. in mathematics from Eotvos Lorand University in Budapest, Hungary. His work has been published in many

journals, including *Stochastic Processes and Their Applications*, *Mathematical Finance*, *Mathematics and Financial Economics*, *Mathematics of Operations Research*, the *Annals of Applied Probability*, and the *SIAM Journal on Control and Optimization*. His research interests include operations research, mathematical finance, and stochastic optimization.

David C. Lane (“High Leverage Interventions: Three Cases of Defensive Action and Their Lessons for OR/MS Today”) is Reader in Management Science at the London School of Economics. He has a doctorate in mathematics from the University of Oxford and worked in Shell International and Shell UK. His research centers on system dynamics mapping and simulation modeling approaches to strategic problems, both in the commercial sector and in public policy. He has written on the social theoretical assumptions of system dynamics and the history and methodology of system dynamics, OR/MS, and systems science. His application-related work includes the dynamics of project management, marketing strategies for movies, and health-care management. His current research concerns the modeling of health-care-associated infections. He has received two awards for teaching excellence and is a Fellow of the Operational Research Society. In 2007 he received the Jay Wright Forrester Award. In 2011 he will serve as president of the System Dynamics Society.

Hsiao-Hui Lee (“A Model of ICU Bumping”) is a doctoral candidate in operations management at the Simon School of Business, University of Rochester. She holds B.S. and M.S. degrees in civil engineering from the National Taiwan University.

Jeffrey T. Linderoth (“R&D Project Portfolio Analysis for the Semiconductor Industry”) is an associate professor in the Department of Industrial and Systems Engineering and the Department of Computer Sciences at the University of Wisconsin–Madison. His main research interests lie in computational methods for solving optimization problems, specifically for integer and stochastic programs.

Zhixin Liu (“Capacity Allocation and Scheduling in Supply Chains”) is an assistant professor of decision science at the College of Business, the University of Michigan–Dearborn. He received a B.A. degree from Nankai University, an M.S. degree from Tsinghua University, and a Ph.D. degree from the Ohio State University. His research interests include operational decisions and their coordination in supply chains, including capacity allocation, inventory management, pricing, project management, and scheduling. This research forms part of his Ph.D. dissertation, which was completed in December 2007 at the Ohio State University under the supervision of Nicholas Hall.

Zongjian Liu (“Sensitivity Estimates from Characteristic Functions”) received his Ph.D. in operations research

from the Department of Industrial Engineering and Operations Research at Columbia University. His research interests focus on applying stochastic modeling and optimization to study financial markets. He is currently working at Goldman Sachs.

Jun Ma (“Optimization Services: A Framework for Distributed Optimization”) is a senior architect at Breakthrough Technologies LLC, a Chicago-based technology and software consulting company. He is also a research fellow at the Industrial Engineering and Management Sciences Department of Northwestern University. He received his M.S. and Ph.D. degrees from the same department in 2005. He was awarded the Cabell graduate fellowship at Northwestern University. While at the university, he also worked at Motorola, Inc. and received the annual Motorola Engineering Award three times. He graduated summa cum laude, with a B.A. in mathematics and economics, from Wabash College in 1999. His research interests are in the general area of optimization, especially large-scale optimization models used in practice.

Kipp Martin (“Optimization Services: A Framework for Distributed Optimization”) is professor of operations research and computing technology in the Booth School of Business at the University of Chicago. Much of his initial research was in the area of integer programming. He has also done applied work in capacity planning, inventory control, and optimal bundle pricing. More recently, his main interest is incorporating Web technologies such as XML, XSLT, XQuery, and Web services into the mathematical modeling process. He is a member of COIN-OR, serves on the COIN-OR Technical Leadership Council, and is a project manager for the COIN-OR Optimization Services project.

Lorenza Montaletti (“An Exact Algorithm for the Two-Dimensional Strip-Packing Problem”) is a software engineer in a company specializing in banking/credit software solutions. She has been involved in a research project for developing new algorithms for cutting and packing problems with the University of Bologna. This research was part of her thesis, completed at the University of Bologna under the supervision of Marco Antonio Boschetti.

Jeffrey E. Moore (“R&D Project Portfolio Analysis for the Semiconductor Industry”) is a senior director in the Supply Chain Systems and Analytics Department at Fairchild Semiconductor Company. Previously he served as a senior director in the Mobile Devices Group at Infineon Technologies and director in the Business Planning and Operations Departments at LSI, Agere Systems, and Lucent Technologies.

José María Moreno-Jiménez (“Consensus Building in AHP-Group Decision Making: A Bayesian Approach”) holds degrees in mathematics and economics and a Ph.D.

in applied mathematics from the University of Zaragoza, Spain. He is full professor of operations research and multicriteria decision making in the Faculty of Economics and Business Administration at the same university. He is chair of the Zaragoza Multicriteria Decision Making Group, a research group attached to the Aragon Institute of Engineering Research. His main fields of interest are multicriteria decision making, environmental selection, and public decision making. He has published more than 160 papers in scientific books and journals including the *European Journal of Operational Research*, *Group Decision and Negotiation*, *Omega*, *Annals of Operations Research*, *Computer Standards and Interface*, the *Journal of Multi-Criteria Decision Analysis*, and *Mathematical and Computer Modelling*.

Wenting Pan (“Optimal Product Pricing and Component Production Quantities for an Assembly System Under Supply Uncertainty”) is a Ph.D. candidate in the Operations and Decision Technologies Group at the Paul Merage School of Business, University of California–Irvine. Her research interests focus on supply uncertainty, dual sourcing, and game theory under assembly structures.

Michael Pinedo (“Optimal Control of a Mean-Reverting Inventory”) received the Ir. degree from the Delft University of Technology, the Netherlands, and the M.Sc. and Ph.D. degrees in operations research from the University of California at Berkeley in 1978. He is the Julius Schlesinger Professor of Operations Management and Chair of the Department of Information, Operations and Management Sciences at the Stern School of Business at New York University. He is the author of *Scheduling: Theory, Algorithms and Systems* (Springer) and *Planning and Scheduling in Manufacturing and Service* (Springer), and coauthor of *Queueing Networks: Customers, Signals and Product Form Solutions*. He is editor of the *Journal of Scheduling* (Springer), associate editor of *Management Science*, associate editor of *Naval Research Logistics*, department editor of *Production and Operations Management*, and associate editor of *Manufacturing & Service Operations Management*.

Edieal Pinker (“A Model of ICU Bumping”) is an associate professor of operations management and computers and information systems at the Simon School of Business, University of Rochester. He holds a B.A. in mathematics from Columbia University and a Ph.D. in operations research from the Massachusetts Institute of Technology. His current research interests are focused on business process design in services and health care, electronic commerce, and homeland security.

Victor V. Podinovski (“Differential Characteristics of Efficient Frontiers in Data Envelopment Analysis”) is an associate professor at Warwick Business School of the University of Warwick. He holds a Ph.D. in mathematics from Moscow State University, and his research focuses on the

mathematical foundations of decision and efficiency analysis. His recent publications include studies on the equivalence of weight restrictions and trade-offs in data envelopment analysis (DEA), hybrid returns-to-scale DEA models, and models based on relaxed convexity axioms.

Paat Rusmevichientong (“Dynamic Assortment Optimization with a Multinomial Logit Choice Model and Capacity Constraint”) is an assistant professor in the School of Operations Research and Information Engineering at Cornell University. His research interests include data mining, information technology, and nonparametric algorithms for stochastic optimization problems, with applications to supply chain and revenue management.

Manuel Salvador (“Consensus Building in AHP-Group Decision Making: A Bayesian Approach”) is a senior lecturer in statistics and operations research at the Faculty of Economics of the University of Zaragoza. He received his Ph.D. in mathematics in 1987. His current research interests include decision theory, Bayesian inference, and hierarchical spatial and dynamic models with applications to economics and business.

Zuo-Jun Max Shen (“Dynamic Assortment Optimization with a Multinomial Logit Choice Model and Capacity Constraint”) received his Ph.D. from Northwestern University. He has been active in the research areas of integrated supply chain design and management, market mechanism design, applied optimization, and decision making with limited information. He serves on the editorial/advisory boards of several leading journals. He received the CAREER award from the National Science Foundation in 2003.

Hyoduk Shin (“Do Firms Invest in Forecasting Efficiently? The Effect of Competition on Demand Forecast Investments and Supply Chain Coordination”) is an assistant professor in the Kellogg School of Management at Northwestern University. He received his Ph.D. from Stanford University Graduate School of Business in 2008. His research interests include demand forecasting in supply chains, product-release strategies in the motion picture industry, and product innovation in supply chains.

David B. Shmoys (“Dynamic Assortment Optimization with a Multinomial Logit Choice Model and Capacity Constraint”) is a professor of operations research and information engineering and a professor of computer science at Cornell University. He obtained his Ph.D. in computer science from the University of California at Berkeley in 1984 and held postdoctoral positions at MSRI in Berkeley and at Harvard University. He held a faculty position at the Massachusetts Institute of Technology before joining the Cornell faculty. His research has focused on the design and analysis of efficient algorithms for discrete optimization problems with applications including scheduling,

inventory theory, computational biology, and most recently, computational sustainability. He is a Fellow of the ACM, was an NSF Presidential Young Investigator, and has served on numerous editorial boards.

Kut C. So (“Optimal Product Pricing and Component Production Quantities for an Assembly System Under Supply Uncertainty”) is professor of operations and decision technologies at the Paul Merage School of Business, University of California–Irvine. His most recent research focuses on procurement and pricing decisions for components or products facing supply uncertainty.

Tunay I. Tunca (“Do Firms Invest in Forecasting Efficiently? The Effect of Competition on Demand Forecast Investments and Supply Chain Coordination”) is an associate professor of operations, information, and technology at the Graduate School of Business (GSB) at Stanford University. He received his Ph.D. from Stanford GSB in 2002. His research interests include economics of technology and operations management, auctions and contracts for procurement, and the role of information and forecasting in supply chains.

Balachandran Vaidyanathan (“Fast Algorithms for Specially Structured Minimum Cost Flow Problems with Applications”) is an operations research advisor at FedEx Express. His research interests are in the area of developing efficient algorithms for solving optimization problems and applying network optimization, integer programming, and

combinatorial optimization to solve real-world problems. He is the author of several publications in top-tier journals. He is the winner of the 2007 Graduate Student Best Paper Award given by the Transportation Research Forum. His research on railroad locomotive and crew scheduling problems have won honorable mentions from the Railroad Application Section of INFORMS.

S. David Wu (“R&D Project Portfolio Analysis for the Semiconductor Industry”) is Dean of the P. C. Rossin College of Engineering and Applied Science at Lehigh University, where he also holds the Lee A. Iacocca Chair. He is the founding director of the Center for Value Chain Research. He serves on the editorial boards of a number of journals in operations research and industrial engineering. His research interests include game theory, optimization, and stochastic analysis. His work in the high-tech industry has been widely recognized and cited, including nomination for the 2009 Daniel H. Wagner Prize.

Gregor Zöttl (“A Framework of Peak Load Pricing with Strategic Firms”) is an assistant professor at Ludwig Maximilian Universität in Munich, Germany. The problem studied in this article is part of a larger body of research analyzing firms’ investment decisions in industries subject to demand fluctuations. One example is the electricity industry, where recent institutional arrangements, such as the introduction of competition, price caps, or cap and trade mechanisms have far-reaching consequences on investment decisions.
