With 12,500 members from nearly 90 countries, INFORMS is the largest international association of operations research (O.R.) and analytics professionals and students. INFORMS provides unique networking and learning opportunities for individual professionals, and organizations of all types and sizes, to better understand and use O.R. and analytics tools and methods to transform strategic visions and achieve better outcomes. For more information on INFORMS, its publications, membership, or meetings visit <http://www.informs.org>

CONTRIBUTORS

Corey Billington is manager of the Strategic Planning and Modeling group at Hewlett-Packard. Dr. Billington leads research and consulting in the areas of manufacturing strategy, supply chain management, and integrative planning for various divisions at HP. His partnership with Professor Lee has resulted in several research publications, and they are continuing to work on advancing new theories and implementation strategies on supply chain management.

Gabriel R. Bitran is the Nippon Telegraph and Telephone Professor of Management at the Sloan School of Management at MIT. His current interests include production planning problems in the semiconductor industry and management of service operations.

R. Alan Bowman is Assistant Professor of Management in the Graduate Management Institute at Union College. **John A. Muckstadt** is Professor and Director of the School of Operations Research and Industrial Engineering at Cornell University. The paper reflects both authors' research interests in scheduling and inventory management in manufacturing systems. This work was done as part of Bowman's doctoral dissertation research at Cornell University.

Shelby Brumelle and **Danny Granot** are Professors in the Management Science Division of the Faculty of Commerce and Business Administration of the University of British Columbia. Granot holds the Affiliates Professor of Management chair. His research includes game theory, combinatorial optimization, and operations management. Brumelle is Acting Chairman of the Division. His research includes applied stochastic processes, multiple objective optimization, and airline yield management.

Jonathan P. Caulkins is Assistant Professor of Operations Research and Public Policy at Carnegie Mellon's H. John Heinz III School of Public Policy and Management. His research focuses on applying operations research to the analysis of drug control policy. One component of this, including this paper, involves modeling how drug markets respond to various interventions.

Sriram Dasu is Assistant Professor in the Anderson Graduate School of Management at UCLA. His research interests include queueing network models of

manufacturing systems and applied probability models arising in the operations management area.

Erik Demeulemeester is Assistant Professor of Operations Management at the K. U. Leuven (Belgium). He is currently teaching total quality control and computer integrated manufacturing. His main research interests include combinatorial optimization and resource-constrained project scheduling.

Bajis Dodin is Associate Professor of Operations Management and Management Science at the Graduate School of Management of the University of California, Riverside. His main research interest is in production planning and scheduling, especially stochastic project management and flexible manufacturing.

Joan M. Donohue is Assistant Professor of Management Science at the University of South Carolina. **Ernest C. Houck** and **Raymond H. Myers** are members of the faculty at Virginia Polytechnic Institute & State University. Houck is Professor of Management Science and Myers is Professor of Statistics. The authors share common research interests in the design and analysis of simulation experiments within the context of response surface methodology. Their article is based on Donohue's dissertation, which was written under the direction of Houck and Myers.

Kevin D. Glazebrook is Reader in Applied Probability in the Department of Mathematics and Statistics, University of Newcastle Upon Tyne. His research is in sequential decision theory and has recently focused on problems in stochastic scheduling and Bayes decision theoretic approaches to screening and testing.

Danny Granot, see **Shelby Brumelle**.

Toshio Hamada is Professor in the Department of Management and Information Sciences at the Himeji College of Hyogo. His research includes the analysis of stochastic scheduling problems in general and bandit problems in particular.

Terry Harrison is Associate Professor of Management Science and Information Systems at Pennsylvania State University. He has interests in modeling various aspects of operations management, especially the use of optimization methods in international manufacturing and distribution decisions. **Jack Martin** is

Assistant Professor of Management at Penn State-Erie. His current interests focus on the management of health care operations. This paper resulted from Martin's dissertation research with Harrison.

Willy Herroelen is Professor of Operations Management and Informatics at the K. U. Leuven (Belgium), where he is chairman of the Department of Applied Economic Sciences. His main teaching and research interests are in quantitative/computer science approaches to operations management problems, in particular project scheduling, line balancing and sequencing, and facilities design.

Ernest C. Houck, see **Joan M. Donohue**.

Rachelle S. Klein is a member of technical staff in the Operations Research Department of AT&T Bell Laboratories. Her research interests include resource allocation and inventory theory. **Hanan Luss** is a supervisor in the same department. His research covers mathematical modeling and optimization, with a current emphasis on research allocation, capacity expansion, manufacturing, distribution, and telecommunications. **Uriel Rothblum** is Professor and Dean of the Industrial Engineering and Management Faculty at the Technion, Israel. His research covers production and inventory models, mathematical programming, sequential decision processes, game theory, and other areas. Their paper, motivated by manufacturing applications, extends previous work by Klein and Luss on allocation of substitutable resources (*Opns. Res.* **39**, 1991).

Hau L. Lee is Professor in the Department of Industrial Engineering and Engineering Management at Stanford University. He started working with Hewlett-Packard four years ago, when he spent his sabbatical there. The current paper was based on his applied research with several divisions at HP. He has continued to work with HP, and is currently conducting research on the relationship between product/process design and supply chain management.

Hanan Luss, see **Rachelle S. Klein**.

Jack Martin, see **Terry Harrison**.

Clyde L. Monma is the Executive Director of the Mathematics, Information Sciences and Operations Research Department at Bellcore. His research includes combinatorial and network optimization, large-scale computer implementations, and telecommuni-

cations models and applications. His most recent work has been on models, methods, and software tools for the design and analysis of communications networks.

Herbert Moskowitz is the Lewis B. Cullman Distinguished Professor of Manufacturing Management and the Director of the Center for Management of Manufacturing Enterprises at the Krannert Graduate School of Management at Purdue University. **Paul V. Preckel** is Associate Professor of Agricultural Economics at Purdue University. **Aynang Yang** is a member of the technical staff at AT&T Bell Laboratories. This work was a part of an NSF-funded research effort to develop a decision analytic methodology and associated decision support system that would allow for imprecise and incomplete assessments. In concept and practice, the approach was designed to reduce the cognitive burden on the decision maker, while simultaneously providing sufficient power to arrive at optimal or near-optimal choices.

John A. Muckstadt, see **R. Alan Bowman**.

Raymond H. Myers, see **Joan M. Donohue**.

Chris N. Potts is Senior Lecturer in the Faculty of Mathematical Studies at the University of Southampton, U. K. His research interests are in combinatorial optimization, especially scheduling problems. Recently, he has focused on models which integrate scheduling with batching and lot sizing decisions.

Paul V. Preckel, see **Herbert Moskowitz**.

Harilaos N. Psaraftis, see **Paul M. Thompson**.

Uriel Rothblum, see **Rachelle S. Klein**.

Paul M. Thompson is Assistant Professor at the Leavey School of Business and Administration of Santa Clara University. **Harilaos N. Psaraftis** is Professor at the National Technical University of Athens, Greece. Both authors have interests in logistics and distribution. The paper in this issue is part of Thompson's dissertation written under the direction of Psaraftis, when both were at MIT's Operations Research Center. It was motivated by research into solution methods for very large-scale and complex ship routing and scheduling problems.

Aynang Yang, see **Herbert Moskowitz**.
