With 12,500 members from nearly 90 countries, INFORMS is the largest international association of operations research (O.R.) and analytics professionals and students. INFORMS provides unique networking and learning opportunities for individual professionals, and organizations of all types and sizes, to better understand and use O.R. and analytics tools and methods to transform strategic visions and achieve better outcomes. For more information on INFORMS, its publications, membership, or meetings visit <http://www.informs.org>

CONTRIBUTORS

Alpern, Steve, see **Wei Shi Lim**.

Beck, Anatole, see **Wei Shi Lim**.

Dimitris Bertsimas is a Professor of Operations Research at the Sloan School of Management and the Operations Research Center at MIT. His interests include discrete optimization and performance analysis, and optimization of stochastic queueing systems. **Georgia Mourtzinou** is a post-doctoral associate at the Operations Research Center at MIT. Her research interests include modeling and optimization of stochastic systems with applications in queueing theory and finance. Their article in this issue is part of Dr. Mourtzinou's dissertation under Professor Bertsimas' supervision.

Lucio Bianco is a Professor of Operations Research at the University of Rome "Tor Vergata," Italy. His research interests focus on combinatorial optimization methods and the application of mathematical programming to transportation and scheduling. **Aristide Mingozzi** is an Associate Professor of Operations Research at the University of Bologna, Italy. His main interests are mathematical programming, combinatorial optimization, graph theory, dynamic programming, and the development of exact and heuristic algorithms for the solution of real-life problems in distribution and scheduling. **Salvatore Ricciardelli** is an Associate Professor of Operations Research at the University of Rome "Tor Vergata," Italy. His research interests include the design of combinatorial optimization methods for routing and project scheduling problems. This paper grew out of their joint interest in the development of efficient algorithms for solving routing problems with real-life constraints.

Gagan L. Choudhury is a technical manager at AT & T Laboratories in Holmdel, NJ where his group is responsible for the performance assessment of various AT & T products and services based on modeling and simulation. **David M. Lucantoni** is vice president and chief technical officer for IsoQuantic Technologies, LLC, Wayside, NJ. IQ Tech develops network-level software solutions for the wireless and wireline telecommunications industry. **Ward Whitt** is a member of the Network Mathematics Research Department in AT & T Laboratories, Murray Hill, NJ. Their paper is a continuation of their work on the numerical inversion of multidimensional transforms and its application to compute performance characteristics in stochastic models.

Matteo Fischetti is a full Professor of Optimization in the School of Mathematics of the University of Udine. **Juan José Salazar González** is an Assistant Professor of Operations Research in the School of Mathematics of the

University of La Laguna. **Paolo Toth** is a full Professor of Optimization Algorithms in the School of Engineering of the University of Bologna. Their main research interests are related to combinatorial and graph theory and applications. The present article grew out of Dr. Salazar's doctoral dissertation.

Marshall Fisher is the Stephen J. Heyman Professor at the Wharton School at the University of Pennsylvania. His research is currently focused on managing the supply of products with difficult to predict demand, particularly how retailers are using information technology to forecast and plan inventories. **Kurt O. Jörnsten** is a Professor in the Department of Finance and Management Science at the Norwegian School of Economics and Business Administration. His current research interests include network optimization, vehicle routing, decomposition, and multiple criteria games. **Oli B. G. Madsen** is an Associate Professor in the Department of Mathematical Modeling at the Technical University of Denmark. His current research interests include vehicle routing and scheduling, large-scale mathematical programming, and yield management. Their work for this article grew out of the authors' long lasting interest in the application of mathematical programming based methods for solving vehicle routing problems.

Nicholas G. Hall is a Professor of Management Sciences and Operations Management at The Ohio State University. His main research interest is the integration of tactical control decisions with issues that arise in modern manufacturing environments, in particular those related to scheduling. He is the author of the operations research chapter in the *Handbook of Industrial Robotics* (second edition, John Wiley & Sons, forthcoming). **Hichem Kamoun** is an Assistant Professor at the Faculté des Sciences Économiques et de Gestion de Sfax, Tunisia. His research interests include scheduling in modern manufacturing systems and supply chain management. **Chelliah Sriskandarajah** is an Associate Professor of Industrial Engineering at the University of Toronto. His research interests lie in the general areas of production planning and scheduling, machine scheduling theory, modeling and analysis of manufacturing systems, and the design of cellular manufacturing systems. Their article grew out of their joint interests in integrated manufacturing systems and is based on part of Professor Kamoun's dissertation at the University of Toronto.

Wallace J. Hopp is the Breed University Professor of Manufacturing Management in the McCormick School of Engineering at Northwestern University, where he is the Director of the Master of Management in Manufacturing

program. His research involves stochastic modeling to support the design and control of production systems. **Mark L. Spearman** is an Associate Professor of Industrial and Systems Engineering at Georgia Tech. His current research is in the areas of production scheduling, facility design, and development of improved control systems. **Rachel Q. Zhang** is an Assistant Professor of Industrial and Operations Engineering at the University of Michigan. Her research interests center on inventory control. This paper, and Zhang's dissertation at Northwestern, grew out of a project to develop better inventory control methods for a manufacturer of mail processing equipment.

Jörnsten, Kurt O., see **Marshall Fisher**.

Kamoun, Hichem, see **Nicholas G. Hall**.

Niklas Kohl, Ph.D., is consultant at COWI Consulting Engineers and Planners in Copenhagen, Denmark, and an external Associate Professor in the Department of Operations Research at the University of Copenhagen. **Oli B. G. Madsen** is an Associate Professor in the Department of Mathematical Modeling at the Technical University of Denmark. His current research interests include vehicle routing and scheduling, large-scale mathematical programming, yield management, and applications of mathematical programming. Their work for this article grew out of the authors' interest in the combination of nonsmooth optimization and large-scale mathematical programming.

Phillip J. Lederer is an Associate Professor of Operations Management at the William E. Simon Graduate School of Business Administration of the University of Rochester. His research is focused on the economic analysis of operations management problems. His diverse interests in operations span the topics of network competition, technology acquisition and capital structure, production control systems, and time based competition. **Lode Li** is a Professor at the Yale School of Management. His recent research involves the economics of operations such as pricing and operation decisions in time-sensitive, competitive markets, coordination of multinational production networks, and coordination of production, financing, and dividend policies.

Li, Lode, see **Phillip J. Lederer**.

Wei Shi Lim is a Lecturer in Decision Sciences at the National University of Singapore. **Steve Alpern** is a Professor of Mathematics at the London School of Economics (LSE). **Anatole Beck** is a Professor of Mathematics at the University of Wisconsin and a Distinguished Visitor at the Centre for Discrete and Applicable Mathematics at the LSE. Their work for this article began with Dr. Lim's dissertation with Professor Alpern, and combines Professor

Alpern's work on rendezvous search with Professor Beck's work on the linear search problem. The authors are frequent collaborators.

Lucantoni, David M., see **Gagan L. Choudhury**.

Madsen, Oli B. G., see **Niklas Kohl** and **Marshall Fisher**.

Joseph Mazzola and **Kevin McCardle** are both Associate Professors in the Fuqua School of Business at Duke University. Their research interests span operations research, decisions sciences, and operations management. Both share a common interest in the management of process innovation. This paper grew out of a conversation about how a firm might value a process innovation. They plan to continue exploration of this topic, using the groundwork developed in this article.

McCardle, Kevin, see **Joseph Mazzola**.

Mingozzi, Aristide, see **Lucio Bianco**.

Mourtzinou, Georgia, see **Dimitris Bertsimas**.

Frederic H. Murphy is a Professor of Management Science/Operations Management in the School of Business and Management at Temple University. His research interests include model formulation technologies and what makes a formulation successful, computing economic equilibria, and energy policy analysis. **Venkat Panchandam** is a logistic engineer with Schneider Logistics, where he works in logistics modeling and planning.

Panchandam, Venkat, see **Frederic H. Murphy**.

Ricciardelli, Salvatore, see **Lucio Bianco**.

Salazar, Juan José González, see **Matteo Fischetti**.

J. George Shanthikumar is a Professor in the Department of Industrial Engineering and Operations Research at the University of California at Berkeley. **Susan H. Xu** is an Associate Professor in the Department of Management Science and Information Systems at the Pennsylvania State University. Their research interests are related to queuing theory and applications.

Spearman, Mark L., see **Wallace J. Hopp**.

Sriskandarajah, Chelliah, see **Nicholas G. Hall**.

Toth, Paolo, see **Matteo Fischetti**.

Whitt, Ward, see **Gagan L. Choudhury**.

Xu, Susan H., see **J. George Shanthikumar**.

Zhang, Rachel Q., see **Wallace J. Hopp**.
