With 12,500 members from nearly 90 countries, INFORMS is the largest international association of operations research (O.R.) and analytics professionals and students. INFORMS provides unique networking and learning opportunities for individual professionals, and organizations of all types and sizes, to better understand and use O.R. and analytics tools and methods to transform strategic visions and achieve better outcomes. For more information on INFORMS, its publications, membership, or meetings visit <http://www.informs.org>

Sigrún Andradóttir ("Dynamic Server Allocation for Queueing Networks with Flexible Servers") is an Associate Professor in the School of Industrial and Systems Engineering at the Georgia Institute of Technology. Her research interests are in the simulation and applied probability fields. More specifically, her research is focused on increasing the efficiency of stochastic simulations so that larger and more complex systems can be analyzed and optimized via simulation, and on determining how organizations can utilize their workforces more effectively.

Hayriye Ayhan ("Dynamic Server Allocation for Queueing Networks with Flexible Servers") is an Associate Professor in the School of Industrial and Systems Engineering at the Georgia Institute of Technology. Her research interests lie in the area of analysis and control of queueing systems. The paper in this issue, coauthored with S. Andradóttir and D. G. Down, is a result of the authors' common interest in developing dynamic server assignment policies that maximize the system throughput in queueing networks with flexible servers.

D. P. de Farias ("The Linear Programming Approach to Approximate Dynamic Programming") is an Assistant Professor of Mechanical Engineering at Massachusetts Institute of Technology. She is interested in the analysis and control of complex systems. This currently translates into research in the areas of large-scale dynamic programming, machine learning, and game theory.

Lingxiu Dong ("Optimal Policies and Approximations for a Serial Multiechelon Inventory System with Time-Correlated Demand") is an Assistant Professor at John M. Olin School of Business of Washington University in St. Louis. Her research interests include multiechelon inventory systems, risk pooling, and information in supply chain.

Douglas G. Down ("Dynamic Server Allocation for Queueing Networks with Flexible Servers") is an Associate Professor in the Department of Computing and Software at McMaster University, Canada. His research interests include scheduling distributed systems and systems with inherent flexibility. The paper in this issue, coauthored with S. Andradóttir and H. Ayhan, is a result of the authors' common interest in developing dynamic server assignment policies that maximize the system throughput in queueing networks with flexible servers.

Izak Duenyas ("Optimal Policies for Inventory Systems with Priority Demand Classes") is the Associate Dean for Faculty Development and Research and John Psarouthakis Professor of Manufacturing Management at the University

of Michigan Business School. His research interests are in supply chain management, production control, and investments in new technology.

Katia C. Frank ("Optimal Policies for Inventory Systems with Priority Demand Classes") completed her Ph.D. at the University of Michigan in 2002. The present work was part of her Ph.D. thesis.

Richard Freling ("A Branch-and-Price Algorithm for the Multiperiod Single-Sourcing Problem") was an Assistant Professor of OR at the Econometric Institute, Erasmus University Rotterdam. His primary interest was in the development and application of optimization models, in particular in the areas of public transport planning and revenue management. He was coauthor of a number of articles in academic journals and books. For several years, he was also a senior consultant at ORTEC Consultants BV in the Netherlands. He was just about to start as a part-time researcher at the OR department of Dutch Railways when he became seriously ill. He died in January 2002 at the age of 34.

Zhiwei Fu ("Genetically Engineered Decision Trees: Population Diversity Produces Smarter Trees") is a senior analyst at Fannie Mae financial services company in Washington, D.C. He studied management science at the University of Maryland's Robert H. Smith School of Business and received his Ph.D. in 2000. This paper is based on his dissertation research.

Paul Glasserman ("Resource Allocation Among Simulation Time Steps") is the Jack R. Anderson Professor and Chairman, Decision, Risk and Operations Division at the Graduate School of Business, Columbia University. He is interested in many areas of applied probability, including simulation and the development of stochastic models for derivatives pricing and risk management. He is author of *Monte Carlo Methods in Financial Engineering*, published by Springer.

Bruce Golden ("Genetically Engineered Decision Trees: Population Diversity Produces Smarter Trees") is the France-Merrick Chair in Management Science at the University of Maryland's Robert H. Smith School of Business. He is editor in chief of *Networks* and previously served as editor in chief of the *INFORMS Journal on Computing*. Over the last six years, he has been interested in data mining. This paper is an outgrowth of that interest.

Suleyman Karabuk ("Coordinating Strategic Capacity Planning in the Semiconductor Industry") obtained his Ph.D. from Lehigh University. His dissertation examines a

number of issues in semiconductor capacity planning using both stochastic optimization and game theoretic models. He is presently an Assistant Professor at the University of Oklahoma.

Sunil Kumar ("Diffusion of Innovations Under Supply Constraints") is an Associate Professor in the Operations, Information and Technology area of the Graduate School of Business, Stanford University. He obtained a Ph.D. in electrical engineering from the University of Illinois at Urbana-Champaign. His research interests include mathematical modeling and analysis of manufacturing systems, service operations, communication networks, and systems in the social sciences using queueing network models and stochastic control theory.

Gilbert Laporte ("A Branch-and-Cut Algorithm for the Undirected Traveling Purchaser Problem") is a Professor of Operations Research at HEC Montréal, Director of the Canada Research Chair in Distribution Management, and Adjunct Professor at the University of Alberta. He is also a member of the Centre for Research on Transportation (serving as director from 1987 to 1991). His research focuses on solving real-life problems arising from routing, scheduling, location, and transportation context by using exact and heuristic approaches.

Hau L. Lee ("Optimal Policies and Approximations for a Serial Multiechelon Inventory System with Time-Related Demand") is the Thoma Professor of Operations, Information and Technology at the Graduate School of Business, Stanford University. His research interests are supply chain management and e-business strategies.

Shreevardhan Lele ("Genetically Engineered Decision Trees: Population Diversity Produces Smarter Trees") is an Assistant Professor of Decision and Information Technologies at the Robert H. Smith School of Business, University of Maryland, College Park. He obtained his Ph.D. in statistics and management science from the University of Michigan Business School, Ann Arbor. He works in the area of data mining for managerial applications.

François Margot ("Decompositions, Network Flows, and a Precedence Constrained Single-Machine Scheduling Problem") is an Assistant Professor at the University of Kentucky. His main area of research is polyhedral combinatorics with a marked interest in branch-and-cut algorithms.

Mainak Mazumdar ("Commitment of Electric Power Generators Under Stochastic Market Prices") is a Professor in the Department of Industrial Engineering at the University of Pittsburgh. His research interests include probability modeling of electric power production costs. These models study the effects of generator reliability and load uncertainty on these costs. The paper applies the methods developed in this research to the construction of a stochastic model for spot prices in the deregulated electric power industry.

Maurice Queyranne ("Decompositions, Network Flows, and a Precedence Constrained Single-Machine Scheduling Problem") is a Professor of Management Science at the Faculty of Commerce and Business Administration of the University of British Columbia, Vancouver, Canada.

S. Raghavan ("Genetically Engineered Decision Trees: Population Diversity Produces Smarter Trees") is an Assistant Professor of Management Science at the University of Maryland's Robert H. Smith School of Business. His current research interests include auctions, data mining, and network design. He serves as an associate editor of *Networks* and holds two U.S. patents. He is a recipient of the George B. Dantzig Dissertation Award from INFORMS.

Jorge Riera-Ledesma ("A Branch-and-Cut Algorithm for the Undirected Traveling Purchaser Problem") is an Assistant Professor of Artificial Intelligence in the School of Computer Science at University of La Laguna, Spain. His main interests include vehicle routing and scheduling, and large-scale mathematical programming techniques.

H. Edwin Romeijn ("A Branch-and-Price Algorithm for the Multiperiod Single-Sourcing Problem") is an Associate Professor in the Department of Industrial and Systems Engineering at the University of Florida. His research interests are in optimization theory and applications to problems in supply chain management, medicine, and finance.

Dolores Romero Morales ("A Branch-and-Price Algorithm for the Multiperiod Single-Sourcing Problem") is an Assistant Professor at the Saïd Business School, University of Oxford, United Kingdom. Her research interests include optimization in supply chain management, data mining, and sampling allocation.

Juan-José Salazar-González ("A Branch-and-Cut Algorithm for the Undirected Traveling Purchaser Problem") is an Associate Professor of Operations Research in the School of Mathematics at University of La Laguna, Spain. His main research interests are combinatorial optimization and applications, including the design of methods for solving routing and telecommunication problems.

Jeremy Staum ("Resource Allocation Among Simulation Time Steps") is an Assistant Professor in the Department of Industrial Engineering and Management Sciences at Northwestern University. This paper involves two of his research interests, variance reduction techniques for simulation and financial engineering.

Jayashankar M. Swaminathan ("Diffusion of Innovations Under Supply Constraints") is the Benjamin Cone Research Professor and Chair of Operations, Technology and Innovation Management area at The Kenan-Flagler Business School, University of North Carolina at Chapel Hill. His research interests are in supply chain management, product variety management, and e-business operations. He obtained his master's and doctorate in management of automation

and manufacturing from the Graduate School of Industrial Administration at Carnegie Mellon University.

Jorge Valenzuela (“Commitment of Electric Power Generators Under Stochastic Market Prices”) is an Assistant Professor in the Department of Industrial and Systems Engineering at Auburn University. His research interests include development of stochastic optimization models for application in the electric power industry. This paper uses these models to solve the self-commitment of generators under deregulation.

B. Van Roy (“The Linear Programming Approach to Approximate Dynamic Programming”) is an Assistant Professor of Management Science and Engineering and Electrical Engineering at Stanford University. His research revolves around computational methods for decision making. The paper in this issue (coauthored with D. de Farias) represents part of an ongoing effort to develop an accessible and practical approach to approximate dynamic programming, together with supporting theory. He has interests in applications involving economics, finance, data mining, logistics, and communication networks.

Albert P. M. Wagelmans (“A Branch-and-Price Algorithm for the Multiperiod Single-Sourcing Problem”) is a Professor of OR at the Econometric Institute, Erasmus University Rotterdam. His primary research interest is the design and analysis of optimization methods, in particular in the areas of production and public transport planning. He is currently the director of the bachelor-master program in econometrics and management science at Erasmus University.

Yaoguang Wang (“Decompositions, Network Flows, and a Precedence Constrained Single-Machine Scheduling Problem”) is an analyst with PeopleSoft Inc., in California.

Edward Wasil (“Genetically Engineered Decision Trees: Population Diversity Produces Smarter Trees”) is a Professor of Management Science in the Kogod School of Business at American University where he has taught courses in managerial statistics, production and operations management, and operations research for 17 years. He serves as the feature article editor of the *INFORMS Journal on Computing* and conducts research in applied data mining and network optimization.

S. David Wu (“Coordinating Strategic Capacity Planning in the Semiconductor Industry”) is the Lee A. Iacocca Professor and Chairman of Industrial and Systems Engineering at Lehigh University. The work described in this paper is part of a larger research project in supply chain intermediation and coordination. One of his research interests is to explore various connections between mathematical programming and game theory. He has worked on such problems in procurement auctions, contracting, and capacity reservation.

Rachel Q. Zhang (“Optimal Policies for Inventory Systems with Priority Demand Classes”) is an Assistant Professor at the Johnson Graduate School of Management, Cornell University. Her research interests include inventory management, production planning and control, managing material flows and financial flows in supply chains, and efficient auctions for supply chain procurement.
